

Queries with Conditions

Conditional logic in SQL queries can be implemented using either the **IF () function** or the **CASE expression**.

1) IF () Function

The IF () function evaluates a specified condition. If the condition is *true*, it returns *one value*; otherwise, it returns *another value*.

Syntax:

IF (condition, value_if_true, value_if_false)

Example:

To check whether the given *number* is positive or negative, we can use the below *IF () function*:

IF (number>0, "positive", "negative")

2) CASE Expression

The CASE expression is used to evaluate multiple conditions sequentially. It returns the corresponding result for the first condition that evaluates to *true*. If none of the conditions are satisfied, the *ELSE* clause provides a default value.

Syntax:

```
CASE
    WHEN condition1 THEN result1
    WHEN conditon2 THEN result2
    .
    .
    .
    ELSE default_value
END
```

Example:

To categorize different salaries of employees, we can use the below *CASE expression*:

```
CASE
    WHEN salary>=100000 THEN "High Salary"
    WHEN salary>=50000 THEN "Medium Salary"
    ELSE "Low Salary"
END
```
